II. Yamaha Autolube

What is Yamaha Autolube?

Yamaha Autolube is an automatic engine lubrication system, which obsoletes the conventional 2-stroke pre-mixing system. Oil stored in the oil tank is metered automatically by an oil pump to the engine on demand, depending on speed and load.

Function of the Yamaha Autolube

The heart of the system is the compact precision oil pump developed by Yamaha engineering staff. It is driven by the engine through the reduction gear, functioning according to the carburetor throttle (accelerator grip). The flow of oil is varied depending on the engine RPM (speed) and load (throttle opening). The proper amount of oil is fed to the engine thus assuring optimum lubrication at all times.

Features of the Yamaha Autolube

The Yamaha Autolube eliminates lubrication problems peculiar to 2-stroke engines with the conventional "pre-mixing" system, and improves many inherent advantages of 2-stroke engines.

1. The Autolube system results in:

- Decreasing oil consumption by $\frac{1}{3}$ of the amount required by a conventional 2-stroke engine.
- Decreased carbon build-up
- Reduced exhaust smoke

2. The Autolube system provides:

- Fresh oil supply
- Smooth lubrication due to large oil particles
- No worries about the quality of oil and oil-fuel mixing ratios

3. The Autolube system means:

- Fuel-"straight" gasoline only
- No pre-mixing of oil and gasoline

* Yamaha Autolube oil guarantees improved engine performance and extended engine life.

III. Nomenclature

IV. Basic Instructions

1. Gasoline and Oil

The Yamaha Enduro 125 AT1, equipped with the Yamaha Autolube system uses straight gasoline as fuel.

Gasoline: Use gasoline of 90 octane rating or more.

Oil: Use Oil for lubrication.

Store it in the separate oil tank located under the seat.

[Autolube Oil]

The Yamaha Autolube Oil, refined especially for this new lubricating device excells in lubrication, cleanliness and liquidity at low temperatures. The performance of the Autolube depends on the quality of oil. Yamaha Autolube Oil is recommended for higher performance and longer life of the engine.

2. Familiarization with Equipments

(1) Main Switch

The main switch has three key positions, OFF, Ignition, and Ignition Lights.

The following chart shows the key positions at which the various system are switched on or off. (The circle (o) denotes "Switch on".)

	OFF	I	II	Instructions
Engine		○	○	To starting the engine, kick the kick pedal or push the electric starter button.
Neutral light		○	○	The change pedal is in neutral.
Meter lamp			○	
Head light			○	
Tail light			○	
Stop light		○	○	The brake is applied.
Horn		○	○	The horn button is depressed.

(2) Fuel Petcock

To allow the fuel to flow into the carburetor, set the fuel petcock lever to OPEN. Should you run low of fuel while driving, turn it to RESERVE. The reserve portion will enable you to drive approximately 25 miles (40 km). When parking, the lever should be turned to STOP.

(3) Handlebar Switches left

- a. To sound the horn, depress the horn button.
- b. To lower the head light beam, push the switch toward you. To raise the beam, push the switch toward front.

(4) Handlebar switch right

Press the electric starter button and the engine will start.

(5) Trip Total Meter

A trip total meter is built in the speedometer. It is designed to total the mileage of each trip. Before starting a trip, set the trip total meter to the zero position.

(6) Rear Cushions

The rear cushion can be adjusted according to load, road conditions, and rider preference.

○How to adjust the rear cushion

Insert the screw driver (service tool) into the adjusting hole and then turn it counterclockwise in order to change the position of the toothed notch.

(7) How to Read the Tachometer

A tachometer is provided so that the rider can easily maintain engine RPM sufficient to keep the engine within the power curve. The standard Yamaha AT1 is designed to run best in the power range between 3,000 rpm and 7,000 rpm.

Never lug your engine! It is recommended not to use red-zone 8500 ~10,000 r.p.m.

The relation between the engine RPM and gears is shown in the diagram below.

3. Pre-operation Check

You should check the following points before each usage.

(1) Is the fuel sufficient?

Make sure that the fuel is sufficient for your driving plan. Fill the fuel tank with gasoline only.

(2) Is the oil sufficient?

If the oil is below the center hole on the glass view port, refill the oil tank with Yamaha Autolube Oil.

(3) Is the tire pressure correct?

The wrong tire pressure affects the riding comfort, steering, and life of tires.

Correct tire pressure:

Front - 14 lbs/in² (1.0 kg/cm²) }
Rear - 17 lbs/in² (1.2 kg/cm²) } For on-the-road-riding

When the tire pressure is reduced below the specified value because of some reason, the tire may slip around the rim. To prevent this slipping of the tire, bead stoppers should be used.

(4) Do the front and rear brakes work effectively?

Try the brake lever (right handlebar) and the foot brake (on the right side of the rear wheel). Check to see if the stop light is functioning.

(5) Do the lights and horn function well?

Check the horn, stop light, head light, meter lamp, etc.

4. Operation

(1) Starting the Engine

The Yamaha Enduro 125 AT1 employs the kick starter and electric starter system. The carburetor is provided with a starting system to produce the rich air-fuel mixture required for easy starting of the engine. It assures quick starting even in extremely cold weather.

Preparation for Starting

- Turn the fuel cock lever to the "OPEN" position.
- Insert the main switch key and turn it to the "Ignition" position.

Make sure the neutral light is on.

The 125 AT1 is equipped with a primary kick starter and electric starter. The engine can be started by kicking the kick pedal or pushing the electric starter button when in neutral or by disengaging the clutch if the transmission is in gear.

Starting When the Engine is Cold

Most engines are more difficult to start in cold weather. For easiest starting, a richer mixture of gas/air can be obtained by operating the starter lever.

- Depress the starter lever.
- Start the engine by kicking the kick pedal or pushing the electric starter button with the accelerator grip closed.

Starting When the Engine is Warm

When the engine is still warm from running or in warm weather:

- Don't use the starter lever.
- Slightly open the accelerator grip, and kick the kick pedal or push the electric starter button.

Warming Up

It is very important to allow a warming-up period of 2 minutes or so after starting the engine.

When the engine is started with the starter lever depressed, release it after starting, and keep the accelerator grip open until the engine begins to run smoothly.

Correct engine warm-up, along with periodic inspection will assure a longer service life for your engine.

(2) Operation Procedure

Shifting Gears

The Yamaha 125 AT1 is equipped with a foot-operated, 5-speed transmission. The purpose of the transmission is to change the ratio of engine RPM (driving power) and speed by means of the various gear combination available.

To shift into NEUTRAL, move the toe section of the change pedal downward and then raise it slightly to the neutral detent. The neutral position is between the First and the Second gear position.

FIFTH

FOURTH

THIRD

SECOND

NEUTRAL

FIRST

Acceleration

- Grip the clutch lever to disengage the clutch.
- Depress the toe section of the change pedal to FIRST.
- Slowly open the accelerator grip (the engine speed begins to increase), and release the clutch lever gently. Done properly, the machine will accelerate smoothly.

Riding on the Road

After starting off, accelerate to approximately 10 mph (15 km/h)

- Disengage the clutch while closing the accelerator grip.
 - To shift the gear into SECOND, raise the toe section of the change pedal one full position.
(In this case, the neutral position is bypassed)
 - Increase engine speed slowly and release the clutch lever. Accelerate to approximately 20~25 mph (30~40 km/h), and shift the gear into THIRD.
 - Decelerate by reversing the above procedure. Close the accelerator grip, disengage the clutch, and then depress the change pedal.
- * Do not run "lug" the engine unnecessarily as the engine may overheat or tend to foul spark plug.

Off-the-road Riding

When you ride your motorcycle over rough land, safety parts may fall off due to shocks from the ground or due to accidents such as turnover, and breakage or loss of parts may result. It is advisable to remove all safety parts before you start riding.

Parts to be removed: Head light, tail light, speedometer, tachometer, and side stand.

Caution on Riding over General Paved Roads at High Speeds:

The AT1 is equipped with tires having a block pattern. As a result, the area where the tire contacts with the ground is smaller as compared with other types of tires. Therefore, take care not to slip your motorcycle when you are cornering at high speeds and at sharp angles.

(3) Stopping

To stop the machine, gradually reduce speed by closing the throttle and apply the front and rear brakes simultaneously.

Remember to apply the front and rear brakes together when running at high speeds. Applying only one brake may cause skidding or overturning.

5. Break in Procedure

To secure a longer life of your Yamaha 125 AT1, a certain period of breaking-in operation is very important.

During the first 600 miles (1,000 km), the various parts of the engine wear and polish themselves to the optimum operating clearances. It is important to avoid prolonged full throttle operation on any condition which might result in excessive heating during this critical period.

Care taken at this time will result in longer life, better dependability and higher performance.

VI. Inspection and Service

Regular inspection and maintenance will keep your motorcycle in top condition.

Daily or periodic inspection by yourself or your Yamaha dealer not only assures a longer life of your motor cycle but prevents any machine trouble. This is "physical checkup" of your machine.

Remember to have the periodic inspection by your Yamaha dealer; otherwise, your machine will not be entitled to the Yamaha warranty plan.

It is advisable, in addition to the periodic inspection at your Yamaha dealer according to the Periodic Inspection Card, you check the machine parts listed below every 30~60 days.

1. Periodic Inspection Guide

Be sure to check the above points before long-distance touring.

2. Inspection and Adjustments

The methods of inspection and adjustments are discussed below. This information will be of value in your daily inspections.

Adjusting the Brakes

Front Brake:

The correct free play of the front brake lever is 0.2 to 0.3 in. (5 to 8 mm). To adjust, turn the adjusting bolt to the front brake cable end/or the adjuster located at the lever. After adjustment, be sure to tighten the lock nut fully.

Rear Brake:

The correct free play of the rear brake pedal is approximately 1 in. (25 mm). To adjust the play, turn the adjusting nut attached to the rear brake cable end half turn at a time.

After the adjustment, check the stop light to see if it functions properly.

Checking the Brake Lining:

Disassemble the wheel assembly every 3,000 miles (5,000 km), and check it for wear and clean the brake shoe and brake drum. Take care not to get any oil on the lining friction surface.

Adjusting the Clutch

The clutch lever should have free play of .080 to .120 in. (2 to 3 mm) to maintain full pressure against the clutch facing. If the play is excessive, clutch actions will be impaired. If the play is insufficient, the clutch will slip.

How to Adjust the Clutch:

To adjust the clutch, turn the adjusting bolt attached to the clutch lever holder or adjuster located at the clutch cable end. After the adjustment, fully tighten the lock nut.

Replacing the Gear Oil

During the breaking-in period, replace the gear oil after 30 days from the purchase or after 300 miles (500 km) running.

After the first replacement, replacement should be made at least every three months or every 1,200 miles (2,000 km).

To drain the oil from the bottom of the crankcase, remove the oil drain plug.

After draining the oil, fully tighten the oil drain bolt, and fill with new oil up to the specified level.

Oil..... SAE 10W/30 MOTOR OIL

Oil Amount.....0.7~0.8 quarts (0.7~0.8 litres)

Checking the Battery electrolyte

If the battery electrolyte is below the minimum level, remove the battery and add distilled water.

Check the overflow pipe for clogging or deformation.

If your motorcycle will not be used for several months, remove the battery and keep it in dry, cool place or have it keep in a service shop.

If stored for more than 60 days, it should receive an occasional recharge. Before reinstallation, it should be fully charged.

Checking the Spark Plug

A spark plug ignites the air-fuel mixture in the cylinder. A dirty plug causes hard starting, engine misfiring and other problems.

Clean carbon from the electrodes and adjust the point gap.

- Remove carbon build-up, with a wire brush or a wire.
- Adjust the spark plug point gap to 0.020~0.030 in. (0.5~0.6 mm).

Standard Spark Plug : B-8E

- Porcelain around the center electrode should be a light tan color.
- Replace the spark plug if the electrodes and porcelain are eroded or cracked. If your machine is frequently ridden at low speeds, the spark plug will become somewhat oily and sooty. Replace it with a hotter type.

Cleaning the Air Cleaner

An air cleaner filters grit and other impurities from the air. If you drive often on dusty roads, be sure to clean it at least once a month.

- a) Remove the oil tank

- b) Remove the air cleaner case cap fitting spring and cleaner case cap.

- c) The cleaner element can be pulled out.

Checking the Carburetor

Each carburetor is set by the factory after careful tests.

Except for the following, do not change the carburetor setting without consulting your local Yamaha dealer.

a. Idling Speed Adjustments

- Fully tighten the pilot air screw ①, and back off it $1\frac{1}{2}$ turns.
- Slightly loosen the adjusting screw of the throttle cable ③ connected to the accelerator grip, and start the engine.
- After warming up the engine, turn the throttle stop screw ② so that the engine increases to 1,200~1,300 rpm.

After this adjustment, loosen the lock nut ⑤ to adjust the play of the throttle cable ③ to 0.02~0.04 in. (0.5~1.0 mm); and turn the throttle cable adjuster ④ while pulling the throttle cable for the adjustment. Then lock the throttle cable with the lock nut.

b. Adjusting the Pump Cable

After adjustment of the carburetor, adjust the pump cable coupled with the throttle valve.

- Slightly turn the accelerator grip from the closed position so that free play of the accelerator grip is nil. (In other words, the throttle valve is ready to open only another slight turning of the throttle.)

- Turn the pump cable adjusting nut so that the marking on the adjusting pulley is aligned with the guide pin.

Adjusting the Drive Chain

The drive chain should have a play of approximately $1\frac{1}{4}$ in. (30 mm) up and down at the center of the lower section with the rear wheel on the ground. Since a dirty chain causes gauling and eventual seizing, apply oil at regular intervals. In addition, wash it in gasoline before oiling at every periodic inspection.

Adjusting Chain Tension:

- a. Loosen the rear brake adjusting screw.
 - b. Loosen the tension bar nuts.
 - c. Loosen the rear wheel nuts ①.
 - d. Loosen the chain adjusting bolt lock nuts, ② and shift the wheel shaft so that both ends of the wheel shaft are positioned evenly by utilizing the marks on the swing arms.
 - e. After adjusting, tighten the tension bar nuts.
 - f. Adjust the play of the brake pedal.
- * After these adjustments, check the play of the brake pedal and function of the stop light.

Cleaning the Muffler

To remove the inner cylinder from the muffler, remove the set screw and pull out the tail pipe.

Remove carbon with a wire brush.

Check the inner cylinder bore for clogging. If clogged, clean it with a wire.

Cleaning the Cylinder Head and Piston

Carbon accumulations around the cylinder head and piston will result in loss of power, engine knock, overheating, and other problems.

- a. Remove the cylinder head and remove carbon from the combustion chamber.
- b. Remove carbon from the piston head.

To clean them, use a wire brush or scraper and rags dampened with solvent.

Cleaning the Fuel Cock Filter

The fuel cock filter removes impurities from gasoline before they flow into the carburetor. A dirty filter clogs the system and as a result, the engine will not work properly. Clean it from time to time. Remove the cup from the fuel cock and remove the filter. Wash it carefully in gasoline and reinstall.

Retightening Screws, Bolts and Nuts

Check the screws, bolts and nuts in the parts listed below and retighten them if necessary.
